

You are working inside an **existing Insolvency / NCLT Case Management application** that has already been under active development.

A basic interface, navigation, case-management structure and several features have already been implemented.

IMPORTANT

Do NOT rebuild the project from scratch.

Do NOT replace the existing architecture simply because you would have designed it differently.

Do NOT recreate existing dashboards, authentication, case workspaces, task systems, document systems, database models or UI components if equivalent functionality already exists.

Your job in this task is to:

inspect the current codebase first, understand what already exists, and integrate one new feature into the existing system: creation/enrichment of a case from the first NCLT admission order received by the Insolvency Professional.

The feature is:

NCLT ADMISSION ORDER INTAKE + MCA COMPANY ENRICHMENT

The user should be able to upload an NCLT admission order and have the application automatically extract useful case information, supplement Corporate Debtor information using MCA data, allow the user to review/correct it, and then populate the already-existing company/case workspace.

1. FIRST INSPECT THE EXISTING PROJECT

Before modifying code, inspect:

- project structure;
- frontend framework;
- backend architecture;
- database;

- existing case/company models;
- existing document upload implementation;
- existing task system;
- existing contacts/stakeholders system;
- existing case workspace;
- existing dashboard;
- existing claims module;
- existing CoC module;
- existing expense module;
- authentication;
- permissions;
- APIs;
- AI integrations, if any;
- existing PDF extraction/document parsing;
- current coding conventions.

Then identify which existing components can be reused.

Produce a concise implementation summary such as:

Existing components that can be reused:

- Case model
- Company workspace
- Documents module
- Task model
- Claims module
- ...

New components required:

- Admission order extraction service
- Intake review screen
- MCA provider
- ...

Then begin coding.

Do not stop after giving the plan.

2. DO NOT DUPLICATE EXISTING FEATURES

This is critical.

For example:

If a Case model already exists: → extend/reuse it.

If a Company / CorporateDebtor model already exists: → reuse it.

If a Task model exists: → create tasks through that existing system.

If there is already a case workspace: → populate it.

If there is already document upload: → extend it to recognize an NCLT Admission Order.

If claims already exist: → activate/link the existing claims feature.

If there is already a contacts/stakeholders model: → use it for Applicant / Financial Creditor / IRP.

Do not create parallel systems such as:

Case
NewCase
ImportedCase

or:

Task
AdmissionOrderTask
NewTask

unless there is a genuine architectural reason.

Prefer integration over duplication.

3. TARGET USER FLOW

Add a workflow similar to:

Review Screen

User corrects/confirms information

Confirm

Existing Company/Case Workspace populated

Relevant initial tasks/checklists created

If the existing application's navigation suggests a better location for this feature, integrate it naturally.

Do not redesign the full interface.

4. REFERENCE DOCUMENT

Use the supplied:

Mahakali Foods Private Limited NCLT Admission Order

as the initial development/test fixture.

Expected high-level values from this PDF include:

Corporate Debtor:

Mahakali Foods Private Limited

Process:

Corporate Insolvency Resolution Process / CIRP

Admission Section:

Section 7, Insolvency and Bankruptcy Code

Tribunal:

National Company Law Tribunal

Bench:

Indore Bench

Case Number:

CP(IB) 72/2024

Order Date:

31-07-2026

CIRP Commencement Date:

31-07-2026

Applicant / Financial Creditor:
Samunnati Financial Intermediation & Services Private Limited

IRP:
Mr. Navin Khandelwal

IRP Registration:
IBBI/IPA-001/IP-P00703/2017-2018/11301

Initial Expense Deposit Directed:
₹1,00,000

Do not hardcode these values.

They are only the expected extraction result for the development fixture.

5. DATA TO EXTRACT FROM THE NCLT ORDER

For this feature, extract only the categories listed below.

A. CASE / CORPORATE DEBTOR IDENTIFICATION

Extract:

corporate_debtor_name
corporate_debtor_cin_if_mentioned
registered_address_if_mentioned

process_type
admission_section

tribunal
nclt_bench
court_number
case_number

order_date
cirp_commencement_date

case_status

Example:

Mahakali Foods Private Limited
Section 7

NCLT Indore
CP(IB) 72/2024
31-07-2026
Admitted

The Corporate Debtor information extracted from the PDF is a candidate for identifying the company.

Current company master information should subsequently be enriched/reconciled using MCA.

6. IRP INFORMATION

Extract:

name
role
IBBI_registration_number
address
email
appointment_date
AFA_valid_until_if_explicitly_mentioned

If the IRP/professional already exists in the application's professional/contact database:

link the existing record.

Do not create a duplicate professional.

Recommended matching order:

IBBI registration number
then exact email
then name

The case-specific assignment should be:

role = IRP

7. APPLICANT / FINANCIAL CREDITOR

Extract:

organisation_name
organisation_cin_if_available
registered_address_if_available

case_role
creditor_type
authorised_signatory_if_explicitly_stated
authorisation_type_if_stated
authorisation_date_if_stated

For the reference case:

Samunnati Financial Intermediation & Services Private Limited

Role:

Applicant / Financial Creditor

Use the application's existing organisation/stakeholder/contact system.

Do not duplicate an existing bank/financial institution record unnecessarily.

8. MCA ENRICHMENT — CORPORATE DEBTOR

After extracting the Corporate Debtor name/CIN, attempt to enrich the company using MCA data.

Build MCA access behind a provider/service abstraction.

For example:

```
class McaProvider:
    async def search_company(self, name: str):
        ...

    async def get_company_master(self, cin: str):
        ...

    async def get_current_directors(self, cin: str):
        ...
```

Adapt this to the existing project's language/framework.

Do not force this exact Python structure if the existing project is TypeScript or uses another service pattern.

9. MCA DATA TO OBTAIN

For the Corporate Debtor obtain, where legitimately available:

legal_company_name
CIN
company_status
company_category
company_subcategory
class_of_company
date_of_incorporation
ROC

registered_office_address
registered_company_email

authorised_capital
paid_up_capital

current_directors / current_signatories

The most important fields for the present application are:

Legal Company Name
CIN
Company Status
Registered Office
Registered Company Email
Current Directors

Store:

mca_last_synced_at
mca_sync_status

if the existing data model supports this.

10. CURRENT DIRECTORS

For each current director/signatory returned through MCA, capture available information such as:

DIN
full_name
designation
appointment_date_if_available
cessation_date_if_available
is_current

Also support:

email
email_source

However:

Never invent or infer the personal email address of a director.

If only the registered company email is available:

Director Email = null
Company Registered Email = available value

The UI must distinguish between:

Registered Company Email
Director's Email

Office staff should later be able to manually add/update director contact details.

11. MCA ACCESS MUST NOT BLOCK DEVELOPMENT

Do not make the rest of the feature dependent upon immediately achieving live MCA automation.

Create a provider abstraction.

Possible implementations:

MockMcaProvider
ManualMcaProvider
OfficialMcaProvider

At minimum implement:

- provider interface;
- mock/test provider;
- manual fallback.

If live MCA access is readily and legitimately available in the current project, integrate it.

Otherwise leave the provider ready for live implementation.

Do not:

- bypass CAPTCHA;
- bypass OTP;
- bypass access controls;
- scrape authenticated/protected MCA data using brittle unauthorized methods;

- store MCA passwords in plaintext.

The application's admission-order feature must work even if MCA temporarily cannot be queried.

12. PDF VS MCA RECONCILIATION

Do not silently replace values.

Example:

FIELD	NCLT ORDER	MCA

Company Name	value A	value B
CIN	value A	value B
Registered Address	value A	value B

If values differ, show them to the user.

For current Company Master data, MCA can be suggested as the current authoritative value, but retain the NCLT-order value as historical/source data.

The user must be able to confirm/correct.

13. CHEQUE / PAYMENT EVIDENCE

The reference order contains cheque-related information.

If such information is explicitly present in an NCLT admission order, extract:

```
cheque_number
cheque_date
bank_name
branch
amount
presentation_date
return_date
return_reason
```

Store it using an existing evidence/financial-event model if one exists.

If no such model exists, create only a lightweight case-linked structure.

Do not add this information to the primary Case Master.

Do not perform debt/legal analysis from this information.

14. DOCUMENTS REFERENCED IN THE ORDER

Identify documents the admission order explicitly indicates exist.

Examples include:

Form 1 Petition
Form 2 Consent

Sanction Letter
Board Resolution
Statement of Account
Ledger

Information Utility / NeSL Record

Cheque Return Memo
Section 138 Notice
Loan Recall Notice

OTS Correspondence
Arbitral Award

Corporate Debtor Reply
Applicant Rejoinder / Written Submissions

IMPORTANT:

The fact that an order mentions a document does NOT mean the office has received that document.

Therefore create or update the existing document-requirement/checklist system with a status such as:

REFERENCED / NOT RECEIVED

If the project already has a document checklist, reuse it.

Do not create another checklist system.

15. PUBLIC ANNOUNCEMENT

If the operative portion of the order directs the IRP to make a public announcement, create a task through the application's **existing task system**.

Example:

Title:

Prepare and issue Public Announcement

Category:

CIRP / Statutory

Priority:

Critical

Source:

NCLT Admission Order

Retain source provenance if existing models support it.

16. ACTIVATE CLAIMS PROCESS

If the case is confirmed as a CIRP admission:

ensure the existing Claims functionality is active/available for that case.

Do not automatically invent claimant records.

If the application already has claim statuses/workflows, use them.

Do not create another claims engine.

17. INITIAL COC WORKFLOW TASKS

Based on directions explicitly found in the admission order, create relevant tasks through the existing task/workflow system.

Possible tasks:

Collate Claims

Determine Financial Position

Constitute Committee of Creditors

Prepare CoC Constitution Report

File CoC Constitution Report

Schedule First CoC Meeting

Do not assume all dates solely from the admission date.

Some deadlines depend upon later events.

Use the application's existing deadline/task dependency capabilities where available.

18. DEPENDENT DEADLINES

If a first CoC meeting deadline depends on the actual filing of the CoC report, do not incorrectly hardcode:

Admission Date + X Days

Instead represent the dependency:

Event:
CoC Report Filed

then:
Create / calculate First CoC Meeting requirement

If the existing application does not yet support event-driven dependent deadlines, implement the smallest reusable extension required.

Do not build an entirely new compliance engine in this task unless necessary.

19. MANAGEMENT INFORMATION / SECTION 19 CHECKLIST

If the order includes the normal direction requiring Corporate Debtor personnel/promoters/management to cooperate with the IRP, populate or activate the existing management-information checklist.

If no such checklist currently exists, add one to the case workspace.

Suggested items:

Books of accounts
Accounting software access

Statutory registers

Bank accounts
Bank statements

Fixed asset records
Plant and machinery records

Stock records

Receivables / debtor records
Creditor records

Employee/workmen records

GST records
Income-tax records
PF / ESIC records

Contracts

Pending litigation details

Insurance details

Plant/factory access

Digital access / system credentials

Corporate statutory records

Other information requested by IRP

Each item should support:

status
requested_date
received_date
reviewed_date
remarks
documents
responsible_person

Reuse existing checklist/task functionality if available.

20. INITIAL OPERATIONAL TAKEOVER CHECKLIST

Where appropriate from the admission order, activate/populate an initial CIRP takeover checklist.

Possible items:

Site / factory visit

Physical access / possession status

Security arrangements

Insurance verification

Electricity / utilities

Operational status

Key employees

Bank accounts

Stock verification

Fixed assets

Plant and machinery

Receivables

Major customers

Major suppliers/vendors

Cash position

IT systems / backups

This checklist represents work to be done.

Do not mark tasks as completed simply because the admission order contains general duties.

21. INITIAL CIRP EXPENSE CONTRIBUTION

If the order directs an applicant/financial creditor to deposit an amount with the IRP, extract:

payer
amount
purpose

direction_date
due_date_if_determinable

status

For the reference case:

Amount:
₹1,00,000

Contributor:
Applicant / Financial Creditor

Initial Status:
Awaiting Payment

Use the existing expense/CIRP cost module if it already exists.

Do not create a separate expense system merely for this feature.

22. STORE THE ORIGINAL NCLT ORDER

The uploaded admission order must remain in the existing case/document-management system.

Store appropriate metadata:

document_type = NCLT Admission Order

case_number
bench
order_date

original_filename
mime_type
page_count

uploaded_at
uploaded_by

Never overwrite the original PDF.

The extracted data is separate metadata derived from the document.

23. EXTRACTION PROVENANCE

This is important.

For AI-extracted fields, retain where possible:

field_name
value

confidence_score / confidence_level

source_document
source_page
source_text

verification_status
verified_by
verified_at

Suggested verification states:

UNREVIEWED
CONFIRMED
CORRECTED
REJECTED

If the existing project already has an extraction/provenance model, reuse it.

24. REVIEW SCREEN

Before committing extracted information to the live case workspace, display a review screen.

Sections:

Case Information

Corporate Debtor
CIN
Process
Admission Section
NCLT Bench
Court
Case Number
Order Date
CIRP Commencement Date
Status

MCA Company Information

Legal Company Name
CIN
Registered Office
Registered Email
Company Status
Current Directors

Applicant / Financial Creditor

Display extracted information.

IRP

Display extracted information.

Documents Referenced

Display checklist.

Actions / Tasks Detected

Display proposed tasks.

Initial Expense Contribution

Display extracted contribution, if applicable.

25. EVERY EXTRACTED VALUE SHOULD BE EDITABLE

Where practical, show:

Extracted Value
Source
Confidence

Allow the user to:

Confirm
Edit
Reject

The two principal buttons should be:

Save Draft

Confirm / Import into Case

If the application already has an existing case before the upload, support:

Update Existing Case

instead of always creating a new one.

26. SUPPORT BOTH NEW CASE AND EXISTING CASE

This is important because the office may upload the admission order in either workflow.

Workflow A

Upload Admission Order
→ New case identified
→ Confirm
→ Create new case

Workflow B

Open existing case
→ Upload Admission Order
→ Extract
→ Confirm
→ Populate/update missing case information

Do not force duplicate cases.

27. DUPLICATE CASE CHECKING

Before creating a new case, check existing records using available fields such as:

Corporate Debtor CIN
Case Number
Corporate Debtor Name + NCLT Bench

If likely duplicate:

Possible Existing Case Found

Allow:

Open Existing Case
Import Into Existing Case
Create New Anyway
Cancel

Do not silently merge.

28. EXPLICITLY EXCLUDED FROM THIS FEATURE

Do NOT add the following based on the admission order during this development task:

Detailed debt/default analysis

Debt reconciliation

Date-of-default inconsistency analysis

Loan/facility master

Repayment schedules

Security/charge extraction

Personal guarantor extraction

AI industry/business classification

Lawyer/counsel extraction

Historical litigation timeline

Moratorium module

These are intentionally outside the present scope.

Do not implement them merely because they appear in the PDF.

29. DO NOT REBUILD EXISTING MODULES

The project already has development work.

Therefore do NOT rebuild:

overall dashboard
whole company workspace
authentication
whole task manager
whole document manager
whole claims manager
whole CoC manager
general contacts system
general expense system

unless one of these genuinely does not exist.

Your task is to make the Admission Order Intake feature **feed information into these existing modules**.

30. AI EXTRACTION

If there is already an AI/LLM abstraction in the repository:

use it.

If not, add a minimal provider abstraction rather than embedding model API calls throughout business logic.

The structured extractor must:

- return JSON / typed structured data;
- return null if information is absent;
- not guess;
- retain source page/text where possible.

Use the project's existing AI provider/configuration if already implemented.

31. PDF PARSING

Reuse existing PDF/document parsing first.

Preferred pipeline:

Uploaded PDF

↓

Existing file storage

↓

Extract embedded text

↓

Only use OCR/vision if extraction is inadequate

↓

Structured AI parsing

Do not unnecessarily OCR digitally searchable PDFs.

32. VALIDATION

Add deterministic validation where useful:

CIN

Check syntax/structure.

IBBI registration number

Normalize for matching but preserve original text.

Dates

Store using the existing application's date conventions.

Currency

Use decimal/numeric storage.

Never use floating-point for rupee amounts.

Email

Validate format.

33. CASE DATA ISOLATION

The application handles many companies simultaneously.

Any data created from this import must belong to the correct company/case workspace.

Examples:

Mahakali tasks

→ only Mahakali workspace

Mahakali documents

→ only Mahakali workspace

Mahakali expense contribution

→ only Mahakali workspace

Mahakali checklist

→ only Mahakali workspace

Do not rely solely on frontend filtering.

Use the existing backend/database case relationship/access rules.

34. AUDIT TRAIL

Use the existing audit system if available.

Record important actions such as:

Admission order uploaded

AI extraction completed

MCA data retrieved

Extracted field corrected

Import confirmed

Case created

Existing case updated

Tasks generated

Checklist generated

If an audit system already exists, do not create a duplicate one.

35. IMPORTANT UI SAFETY

When importing into an existing case, prominently display:

You are importing this order into:

MAHAKALI FOODS PRIVATE LIMITED
CP(IB) 72/2024

This reduces the risk of an office staff member importing a judicial order into the wrong company.

36. EXPECTED RESULT FOR THE REFERENCE PDF

When the Mahakali PDF is uploaded, the review screen should broadly identify:

Mahakali Foods Private Limited

NCLT Indore Bench

CP(IB) 72/2024

Section 7 CIRP

Order Date:
31 July 2026

CIRP Commencement:
31 July 2026

Applicant:
Samunnati Financial Intermediation & Services Private Limited

IRP:
Navin Khandelwal

IRP Registration:
IBBI/IPA-001/IP-P00703/2017-2018/11301

Initial Expense Contribution:
₹1,00,000

It should also detect relevant operative tasks/checklists from the order.

37. TESTING

Add tests that fit the project's existing testing architecture.

At minimum test:

Admission order upload

PDF extraction

Structured extraction schema

Reference Mahakali fields

Review/save draft

Confirm into an existing case

Confirm creating a new case

Duplicate case detection

MCA mock/manual enrichment

MCA-vs-order reconciliation

Task generation

Document requirement generation

Initial expense contribution generation

Case isolation

Do not rewrite the whole project's testing stack.

38. MIGRATIONS

Only add database migrations for genuinely missing fields/tables.

Before creating a new table, search existing models to see whether the concept already exists.

Examples:

If contacts already represents directors: → extend/reuse it.

If organisations already stores companies: → reuse it.

If a generic case_party relationship already exists: → use that for Applicant/Financial Creditor.

Keep schema changes minimal and coherent.

39. DEVELOPMENT APPROACH

Proceed in this order:

Step 1

Inspect existing project.

Step 2

Identify reusable components and missing pieces.

Step 3

Create/update data structures only where necessary.

Step 4

Implement admission-order extraction.

Step 5

Implement intake review UI.

Step 6

Integrate MCA provider/mocks/manual fallback.

Step 7

Integrate confirmation with existing Case workspace.

Step 8

Generate appropriate tasks/checklists through existing systems.

Step 9

Test.

Step 10

Run application, migrations, lint, type checks and tests.

Fix errors found.

40. REPORT BACK AFTER IMPLEMENTATION

At completion tell me:

Existing functionality reused

List what was already in the project and reused.

Files changed

List modified/new files.

Database changes

Describe migrations, if any.

New functionality

Describe what now works.

MCA status

State whether:

Live MCA provider working
Mock provider working
Manual fallback working

and any limitations.

Testing

Report actual tests/lint/type checks run and their results.

How to use

Give short user steps:

Open...
Click...
Upload...
Review...
Confirm...

Remaining work

Only list genuinely incomplete pieces.

41. MOST IMPORTANT CONSTRAINT

Do not treat this prompt as a request to rebuild the complete insolvency management system.

The existing application already contains work done in earlier development sessions.

This prompt adds one focused feature:

Read the first NCLT admission order received in a case, extract useful information, enrich the Corporate Debtor using MCA, let the user verify the data, and populate the existing case workspace plus the directly related initial tasks/checklists.

Preserve and extend the existing system.
